

25mm HIGH,
90° BENDS...

... NOW POSSIBLE ON YOUR
PUNCH PRESS MACHINE

- **High Bends**

Bends as high as 25mm and up to 55mm wide are possible due to the special rolling design of the **Optibend** tool.

- **Fewer Secondary Operations**

Because the **Optibend** tool allows you to produce bends previously only possible on a press brake machine, you can increase the speed of production by reducing the amount of time the part spends moving around the shop.

- **Reduced Marking**

To further reduce the number of secondary operations **Optibend** is fitted with a special die cap designed to reduce sheet marking on soft or highly polished materials.

- **Form after Form**

The specially relieved upper unit allows you to bend the part after you've produced other forms: for example you can produce a threadform or louvre in the component and then bend it up at 90°.
